

WHYTL & the ASI Governance Stack

A constraint-first sovereign AI infrastructure program — built for the reason you said you're worried people aren't building it

“What they are doing is trying to buy something that cannot be bought — alignment with the mission.”

— Dario Amodei, on rival AI labs' compensation-driven poaching (Axios, Aug 2026)

No funding. No co-founders. No employer, mandate, or lab behind it. Over the past 18 months, XWHYZ's research division, WHYLD, independently built WHYTL — a 16-block, 7-layer constraint-first sovereign AI governance stack — and published every component of it openly, timestamped, and free for scrutiny. It exists because the problem you're describing is real, not because a paycheck asked for it.

WHAT WHYTL IS

- A 16-block, 7-layer constraint-first architecture for sovereign AI alignment and governance infrastructure — not a policy paper, a working technical stack with tests, signatures, and running code.
- Foundational components already public and independently citable: the **ASI Governance Canon** (66 articles across 10 phases, MIT-licensed), **UPIF**, **UCS/EchoNet**, and **SBL/SBTA** (Sovereign Behavioral Lag — measuring the gap between a state's declared AI policy and its deployed systems' actual behavior).
- Already submitted for review to NIST, the UK AI Security Institute, the EU AI Office, the G7 Hiroshima AI Process, and the UAE Federal AI & Data Authority.

PROOF OF WORK — TIMESTAMPED, PUBLIC RECORDS

WHYTL — full stack	10.5281/zenodo.20109355
ASI Governance Canon	10.5281/zenodo.19538857
UPIF	10.5281/zenodo.15242693
UCS / EchoNet	10.5281/zenodo.19533332
SBL / SBTA	10.5281/zenodo.19915318

I'd like 15 minutes of review time from your research or policy team — whoever is the right reader for constraint-first governance work. Happy to be routed anywhere useful.
